

Block 1 — Doorway & Setup

Goal

Get Claude Code running in your terminal and have your first conversation. By the end you will have typed `claude` and asked it to describe a folder — proving the terminal is just a place to *talk to an assistant*, not to memorise commands.

Type this

1. Open your terminal (facilitator will show where).
2. Confirm the tool is installed: `claude --version`
3. Start it: `claude`
4. In the chat, type: `What files are in this folder, and what do they look like they're for?`

You should see

- A version number on `claude --version`.
- After `claude`, a welcome prompt where you can type in plain English.
- A short, plain-language summary of the folder's contents.

If it looks wrong

- `command not found` → tell the facilitator; do the install step together.
- It asks you to log in → follow the browser sign-in, then return to the terminal.
- It does nothing → say in the chat: `List the files here and explain them simply.`
