

Block 2 — what a correct monthly report looks like

Running `b2-sales-summary.py` on `data/orders.csv` prints a 12-row monthly table for **July 2024** → **June 2025**, with revenue rising into the holiday season and peaking in December.

- **Best month: 2024-12** — revenue **97,138.60** (raw file, which keeps the duplicate orders; a de-duplicated total would be slightly lower).
- Total revenue (raw): about **820,000**.

The lesson (say it out loud): the report *ran* — but running is not the same as *right*. Always check a known number. Here the known number is the December peak: if the AI's "best month" is not 2024-12, its revenue formula is wrong (it probably summed `quantity` instead of `quantity * unit_price`).
